  - ▶ Has to represent large-scales.
  - ▶ Grid spacing  $\Delta x$  small enough to resolve dissipative scales.

# Direct Numerical Simulations (DNS)

## Method

Start with a reformulated Navier Stokes equation in Fourier space.

$$\left( \frac{\partial}{\partial t} - \nu \nabla^2 \right) u_\alpha(\mathbf{k}, t) = M_{\alpha\beta\gamma}(\mathbf{k}) \left[ \sum_{\mathbf{j}+\mathbf{l}=\mathbf{k}} u_\beta(\mathbf{j}, t) u_\gamma(\mathbf{l}, t) \right] \quad (3)$$

A discretisation in time and wavenumber is needed to obtain a numerical solution.

$$k_\alpha = \frac{2\pi}{L} n_\alpha \quad n_\alpha = 0, 1, \dots, N-1 \quad (4)$$

Non-linear term:

$$A_{\beta\gamma}(\mathbf{k}, t) = \sum_{\mathbf{j}+\mathbf{l}=\mathbf{k}} u_\beta(\mathbf{j}, t) u_\gamma(\mathbf{l}, t) \quad (5)$$

# Direct Numerical Simulations (DNS)

## Method

The non-linear term is computationally costly. The convolution theorem can help with that.

1. Perform Fast Fourier Transform (FFT) on velocity fields  $(u_\alpha(\mathbf{x}, t))$ .

# Direct Numerical Simulations (DNS)

## Method

The non-linear term is computationally costly. The convolution theorem can help with that.

1. Perform Fast Fourier Transform (FFT) on velocity fields  $(u_\alpha(\mathbf{x}, t))$ .
2. Convolve the transformed fields.

$$A_{\beta\gamma}(\mathbf{x}, t) = u_\beta(\mathbf{x}, t)u_\gamma(\mathbf{x}, t) \quad (6)$$

# Direct Numerical Simulations (DNS)

## Method

The non-linear term is computationally costly. The convolution theorem can help with that.

1. Perform Fast Fourier Transform (FFT) on velocity fields ( $u_\alpha(\mathbf{x}, t)$ ).
2. Convolve the transformed fields.

$$A_{\beta\gamma}(\mathbf{x}, t) = u_\beta(\mathbf{x}, t)u_\gamma(\mathbf{x}, t) \quad (6)$$

3. Transform  $A_{\beta\gamma}(\mathbf{x}, t)$  to  $A_{\beta\gamma}(\mathbf{k}, t)$  to obtain the l.h.s term in the solenoidal Navier Stokes equation.

# Direct Numerical Simulations (DNS)

## Method

The non-linear term is computationally costly. The convolution theorem can help with that.

1. Perform Fast Fourier Transform (FFT) on velocity fields ( $u_\alpha(\mathbf{x}, t)$ ).
2. Convolve the transformed fields.

$$A_{\beta\gamma}(\mathbf{x}, t) = u_\beta(\mathbf{x}, t)u_\gamma(\mathbf{x}, t) \quad (6)$$

3. Transform  $A_{\beta\gamma}(\mathbf{x}, t)$  to  $A_{\beta\gamma}(\mathbf{k}, t)$  to obtain the l.h.s term in the solenoidal Navier Stokes equation.
4. Use a suitable finite-differences method for evolving the velocity field in time [1].

# Direct Numerical Simulations (DNS)

## Why Pseudo-Spectral?

So... Why pseudo-spectral?

# Direct Numerical Simulations (DNS)

## Why Pseudo-Spectral?

So... Why pseudo-spectral?

Performing FFT can be a costly endeavor. ( $N \log_2 N$ )

# Direct Numerical Simulations (DNS)

## Why Pseudo-Spectral?

So... Why pseudo-spectral?

Performing FFT can be a costly endeavor. ( $N \log_2 N$ )

Decrease in computational cost!

# Direct Numerical Simulations (DNS)

## Why Pseudo-Spectral?

So... Why pseudo-spectral?

Performing FFT can be a costly endeavor. ( $N \log_2 N$ )

**Decrease in computational cost!**

Arithmetic operations required for calculating the non-linear term:

- ▶ Before FFT:  $\mathcal{O}(N^6)$ .

# Direct Numerical Simulations (DNS)

## Why Pseudo-Spectral?

So... Why pseudo-spectral?

Performing FFT can be a costly endeavor. ( $N \log_2 N$ )

**Decrease in computational cost!**

Arithmetic operations required for calculating the non-linear term:

- ▶ Before FFT:  $\mathcal{O}(N^6)$ .
- ▶ After FFT:  $\mathcal{O}(N^3 \log_2 N)$ .

# Magnetohydrodynamics with DNS

## Framework

Magnetohydrodynamics (MHD) study electrically conducting fluids.

Equations of fluid motion are obtained by combining Navier Stokes equations with Maxwell's equations.

$$\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{u} = -\frac{1}{\rho} \nabla P + \frac{1}{\rho} (\nabla \times \mathbf{b}) \times \mathbf{b} + \nu \nabla^2 \mathbf{u} + \mathbf{f}_u \quad (7)$$

$$\frac{\partial \mathbf{b}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{b} = (\mathbf{b} \cdot \nabla) \mathbf{u} + \eta \nabla^2 \mathbf{b} + \mathbf{f}_b \quad (8)$$

# Magnetohydrodynamics with DNS

## Framework

Magnetohydrodynamics (MHD) study electrically conducting fluids.

Equations of fluid motion are obtained by combining Navier Stokes equations with Maxwell's equations.

$$\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{u} = -\frac{1}{\rho} \nabla P + \frac{1}{\rho} (\nabla \times \mathbf{b}) \times \mathbf{b} + \nu \nabla^2 \mathbf{u} + \mathbf{f}_u \quad (7)$$

$$\frac{\partial \mathbf{b}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{b} = (\mathbf{b} \cdot \nabla) \mathbf{u} + \eta \nabla^2 \mathbf{b} + \mathbf{f}_b \quad (8)$$

$$Re = \frac{uL}{\nu} \qquad Re_m = \frac{uL}{\eta} \quad (9)$$

# Magnetohydrodynamics with DNS

## Magnetic Prandtl Number

$$Re = \frac{\text{inertial forces}}{\text{viscous forces}} = \frac{u L}{\nu} \qquad Re_M = \frac{\text{inertial forces}}{\text{diffusive forces}} = \frac{u L}{\eta}$$

# Magnetohydrodynamics with DNS

## Magnetic Prandtl Number

$$Re = \frac{\text{inertial forces}}{\text{viscous forces}} = \frac{u L}{\nu} \quad Re_M = \frac{\text{inertial forces}}{\text{diffusive forces}} = \frac{u L}{\eta}$$

$$Pr_M = \frac{Re_M}{Re} = \frac{\nu}{\eta} \quad (10)$$

# Magnetohydrodynamics with DNS

## Magnetic Prandtl Number

$$Re = \frac{\text{inertial forces}}{\text{viscous forces}} = \frac{u L}{\nu} \quad Re_M = \frac{\text{inertial forces}}{\text{diffusive forces}} = \frac{u L}{\eta}$$

$$Pr_M = \frac{Re_M}{Re} = \frac{\nu}{\eta} \quad (10)$$

$Pr_m < 1$  when most energy is dissipated through the magnetic channel.

$Pr_m > 1$  when most energy is dissipated through the kinetic (viscous) channel.

# Magnetohydrodynamics with DNS

## Magnetic Prandtl Number

**Figure:** Map of “typical” objects in the plane  $(Re, Re_M)$ . Yellow dashed lines are  $Pr_M$  isolines. [3].

## Conclusions

# DNS at Work

## Non-unity Magnetic Prandtl Number

A well known research on non-unity magnetic Prandtl numbers is:

G. Sahoo, P. Perlekar, and R. Pandit, “Systematics of the magnetic-prandtl-number dependence of homogeneous, isotropic magnetohydrodynamic turbulence”.

# DNS at Work

## Non-unity Magnetic Prandtl Number

A well known research on non-unity magnetic Prandtl numbers is:

G. Sahoo, P. Perlekar, and R. Pandit, “Systematics of the magnetic-prandtl-number dependence of homogeneous, isotropic magnetohydrodynamic turbulence”.

Range of achieved Magnetic Prandtl Numbers:  $[0.01 : 10]$ .

# DNS at Work

## Non-unity Magnetic Prandtl Number

Sahoo et. al. use a DNS method with:

- ▶ Time-stepping strategy is the Adams-Bashforth scheme.

# DNS at Work

## Non-unity Magnetic Prandtl Number

Sahoo et. al. use a DNS method with:

- ▶ Time-stepping strategy is the Adams-Bashforth scheme.
- ▶  $N = 512$  and  $N = 1024$ .

# DNS at Work

## Non-unity Magnetic Prandtl Number

Sahoo et. al. use a DNS method with:

- ▶ Time-stepping strategy is the Adams-Bashforth scheme.
- ▶  $N = 512$  and  $N = 1024$ .
- ▶ Study decaying and statistically steady turbulence.

# DNS at Work

## Non-unity Magnetic Prandtl Number

Sahoo et. al. use a DNS method with:

- ▶ Time-stepping strategy is the Adams-Bashforth scheme.
- ▶  $N = 512$  and  $N = 1024$ .
- ▶ Study decaying and statistically steady turbulence.
- ▶ 2/3–rule as a dealiasing method.

# DNS at Work

## Non-unity Magnetic Prandtl Number

## Results

Study decaying simulations with varying magnetic Prandtl Number.

Study decaying simulations with varying magnetic Prandtl Number.

$$\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{u} = -\frac{1}{\rho} \nabla P + \frac{1}{\rho} (\nabla \times \mathbf{b}) \times \mathbf{b} + \nu \nabla^2 \mathbf{u} + \mathbf{f}_u \quad (11)$$

$$\frac{\partial \mathbf{b}}{\partial t} + (\mathbf{u} \cdot \nabla) \mathbf{b} = (\mathbf{b} \cdot \nabla) \mathbf{u} + \eta \nabla^2 \mathbf{b} + \mathbf{f}_b \quad (12)$$

$$\mathbf{f}_u = \mathbf{0} \qquad \mathbf{f}_b = \mathbf{0} \quad (13)$$

# DNS at Work

## Results

Runs (f-h) have higher Reynolds numbers compared to their (a-e) equivalents.

**Figure:** Total (red), kinetic (green), and magnetic (blue) energy dissipation ratios for a:  $Pr_M = 0.1$ , b:  $Pr_M = 0.5$ , c:  $Pr_M = 1.0$ , d:  $Pr_M = 5.0$ , e:  $Pr_M = 10.0$ , f:  $Pr_M = 1.0$ , g:  $Pr_M = 5.0$ , h:  $Pr_M = 10.0$  [4].

## Conclusions

# Conclusions

1. Direct Numerical Simulations look in a large spectral range.

# Conclusions

1. Direct Numerical Simulations look in a large spectral range.
2. To avoid extremely high computational complexity ( $\mathcal{O}(N^6)$ ), convolution theorem and FFTs can help.

# Conclusions

1. Direct Numerical Simulations look in a large spectral range.
2. To avoid extremely high computational complexity ( $\mathcal{O}(N^6)$ ), convolution theorem and FFTs can help.
3. Increases in computing power will allow broadening  $Pr_M$  ranges under study.
